DETAILED ACTION

Allowable Subject Matter

Claims 13-19 and 21-26 are allowed.

With respect to independent claims 13, 21 and 26, the prior art does not disclose, in the claimed environment, a method for determining the residence time of motile specimens on a force transducing sensor, wherein an interaction of the motile specimens with the force transducing sensor is used to measure a concentration of the motile specimens in a medium, and is categorized as one of an impact, an oscillation, and a retention to facilitate identifying a binding behavior of the motile specimens. The Thundat, Welland and Oden references (as described in the rejections set forth in previous Office Actions) represent the closest prior art by describing the detection of analytes using at least one microcantilever. Oden, in particular, teaches that the concentration of analytes may be determined by evaluating a change in the vibrational frequency of the cantilever. None of these references, however, discloses calculating the residence time of the motile specimen on the sensor, measuring a motile frequency, or categorizing the binding behavior of the motile specimen to the sensor. The Craighead (US 20110020834) and Prater (US 20050121615) references are additionally cited as disclosing the state of the art regarding force transducing sensors, but, like Thundat, Welland and Oden, fail to disclose Applicant's claimed method.
